

BASERA PLATFORM DOCUMENTATION

Demo Guide for Every Role

A plain-language, step-by-step walkthrough for demoing Basera to any audience

7 Roles Covered

No Setup Needed

Laymen-Friendly

Prepared August 23, 2026

Basera — Demo Guide for Every Role

A plain-language, step-by-step walkthrough of what to show and say when demonstrating Basera to anyone — an investor, a potential host, a university administrator, or a family. No technical background needed. Every feature described below works today in "demo mode," with no database or setup required.

How to Use This Guide

Basera serves seven different kinds of people, and each one sees a different side of the same platform. Pick the role that matches who you're demoing to — or use the "Full Combined Demo Flow" at the end for a single 15–20 minute walkthrough that touches every role in one narrative.

All demo accounts use the password `password123`.

Figure 1: Every role, its login, and where to find it.

Role	Login Email	Demo Entry Point
Student	student@basera.pk	/dashboard
Independent Host / Landlord	landlord@basera.pk	/host/dashboard
Hostel Group Owner	owner@basera.pk	/hostel-groups/royal-group
Warden	warden@basera.pk	/warden/dashboard

Role	Login Email	Demo Entry Point
Hotel / Guest House Owner	landlord@basera.pk (same host login)	/host/stays
Admin	admin@basera.pk	/admin/dashboard
Parent / Guardian	no login needed	a share link generated by a student

Role 1: Student — "I need a safe place to live near my university"

Who this is: An outstation student or young professional moving to a new city for university or work, worried about being scammed, ending up with a bad roommate, or paying a deposit for a room that doesn't match its photos.

What Basera solves for them: A search experience where every listing carries real verification, rent is held safely until move-in, and — uniquely — they can see *what kind of person* they'd be rooming with before ever committing.

Figure 2: The homepage — real listings, verification badges, and escrow messaging front and center.

Demo script: 1. Open the homepage with no login. Point out the listings are real (pulled live from the platform, not placeholder content), and the "Verified & Safe" / "Escrow-Protected Rent" badges in the hero section. 2. Search a city or university (try "NUST" or "Royal" — the latter demonstrates Hostel Groups, surfacing every branch of a chain under one badge). 3. Open a room with existing occupants and scroll to the **Roommates panel**:

Figure 3: "Currently living here: 1 Working Professional — Mathematics Teacher — quiet, early sleeper, can help with calculus." No name, no contact info — just what a prospective tenant actually needs to decide.

4. Log in as `student@basera.pk` and open the **Dashboard**:

Figure 4: Bookings, payments, roommate compatibility tools, and the AI-powered decision lab.

5. Walk through starting a booking — point out that the host's phone/email stay hidden until payment, and the optional Deposit Protection add-on at checkout.
6. Open the AI concierge and ask something like "What documents do I need to book a room?" — if `CLAUDE_API_KEY` is configured, this is a real AI response, not a scripted chatbot.

Be upfront if asked: Deposit Protection is a real fee/claims flow on the platform side, but not yet backed by a licensed insurance underwriter.

Role 2: Independent Host / Landlord — "I want to fill my rooms faster and get paid reliably"

Who this is: Someone who owns or manages one hostel, PG, or a handful of rooms and currently relies on word of mouth or informal listings.

What Basera solves for them: A dashboard that fills vacancies, prices rooms intelligently, and guarantees payment without them having to chase tenants for rent.

Figure 5: Smart Pricing reasoning from real occupancy, comparable prices, and academic-calendar seasonality — not a flat guess.

Demo script: 1. Log in as `landlord@basera.pk` and open the **Growth Center**. 2. Show the **Smart Pricing** card — explain that it reads out a plain-language explanation, not just a number, based on actual occupancy and nearby comparable prices. 3. Show the room inventory, tenant list, and finance/ledger view. 4. Point out the SaaS subscription tiers (Starter/Pro/Premium) for hosts who want more visibility and tools.

Be upfront if asked: SaaS tier pricing is still being finalized — don't quote specific PKR figures until the pricing page is published.

Role 3: Hostel Group Owner — "I run multiple hostels under one brand"

Who this is: An owner or operator with several hostel branches across one or more cities, who wants to be recognized as a trusted, established brand rather than a series of unrelated listings.

What Basera solves for them: A single verified identity for the whole chain, so searching for the brand name surfaces every branch, and each branch benefits from the group's collective reputation.

Figure 6: "Royal Group of Hostels" — one verified badge, three branches, all searchable by the group name.

Demo script: 1. From the homepage, search **"Royal"** — every branch of Royal Group of Hostels appears in results. 2. Click through to `/hostel-groups/royal-group` to show the branded group page listing all branches with their own pricing and location. 3. Log in as `owner@basera.pk` to show the property listing flow a group owner uses to attach a new branch hostel to their existing group.

The pitch to a real group owner: "List your whole chain under one verified brand on Basera" — this is as much a B2B acquisition tool as a student-facing feature.

Role 4: Warden — "I manage one block of a larger hostel day-to-day"

Who this is: Staff responsible for a specific physical section (block) of a larger property — not the owner, and not authorized to see or manage the rest of the property.

What Basera solves for them: A focused dashboard scoped only to their block, plus a way to record real-world situations (like a seat filled through an informal, off-platform arrangement) without needing the owner to re-list anything.

Figure 7: The Warden Dashboard — assigned block only, with the manual seat-booked override.

Demo script: 1. Log in as `warden@basera.pk` and open `/warden/dashboard` — note that only their assigned block's rooms and seats are visible (this is enforced by the server, not just hidden in the interface). 2. Demonstrate **Mark Seat Booked (Offline)**: click it on a vacant bed, enter a reason (e.g. *"family paid cash directly, verified on-site"*), and show it turn into the distinct amber "Booked Offline" state. 3. Click **Release** to show the action is fully reversible.

The real-world problem this solves: seats filled through informal arrangements no longer show as falsely available online, without needing a full re-listing cycle.

Role 5: Hotel / Guest House Owner — "I rent out a property nightly, not monthly"

Who this is: An owner of a guest house, hotel, or short-stay property in a tourist destination (Murree, Naran, etc.) — a different business from student housing, but one that benefits from the same trust infrastructure.

What Basera solves for them: Access to the same verification and booking system as the student marketplace, tailored for nightly rates and date-range bookings instead of monthly rent.

Figure 8: The Stays vertical — visually distinct from student listings, built for a different audience and intent.

Demo script: 1. Navigate to `/stays` and search "Murree." Point out the nightly-rate cards, deliberately styled differently from the monthly student listings. 2. Open a property and show the date-range booking form. 3. Log in with the host account and open `/host/stays` to show the owner-facing manager for these listings.

Be upfront if asked: unlike the student flow, guest contact is shared at booking time rather than gated — a deliberate choice given the shorter, lower-risk nature of a 1–3 night stay, not an inconsistency.

Role 6: Admin / Trust & Finance Ops — "I keep the whole platform honest"

Who this is: Internal Basera staff responsible for verifying new listings, resolving disputes, and monitoring the platform's finances.

What Basera solves for them: A command center for everything that keeps the marketplace trustworthy — without this role, none of the trust promises made to students and hosts would be enforceable.

Demo script: 1. Log in as `admin@basera.pk` and open `/admin/dashboard`. 2. Show the verification queue (new hosts/listings awaiting approval), the finance command room (escrow balances, payout approvals), and the dispute resolution workflow. 3. Show the trust center — moderation queues, review classification, and the incident timeline.

Role 7: Parent / Guardian — "I want reassurance without micromanaging"

Who this is: A parent who wants visibility into their child's living situation without needing an account or having to personally verify anything.

What Basera solves for them: A read-only view, shared by the student on their own terms, showing safety-relevant information without requiring the parent to learn a new platform.

Demo script: 1. From the student dashboard, show the **Parent Share Link** feature being generated. 2. Open that link in a private/incognito window to show the parent's read-only view — safety summary, visit scheduling, no ability to message the host or make changes. 3. Note the bilingual English/Urdu toggle, which today is most fully built out on this specific portal.

Full Combined Demo Flow (~15–20 minutes)

Use this sequence when presenting to a single audience that wants the whole story, not just one role:

1. **Open with the problem (2 min).** Land on the homepage with no login. Point out real listings and trust badges — this is the trust-first framing that differentiates Basera from informal Facebook-group room hunting.
2. **Search and discovery (2 min).** Show city/university filtering, the map view, and search "Royal" to demonstrate Hostel Groups.
3. **Roommate visibility — the differentiator (3 min).** Open a shared room, show the Roommates panel, then log in as a student to show how visibility is controlled (including the opt-out toggle).
4. **Booking and escrow (2 min).** Walk through starting a booking, contact gating, the Deposit Protection add-on, and the escrow explanation.
5. **Warden Dashboard — operational trust (2 min).** Show the manual seat-booked override and its reversibility.
6. **Host side: Growth Center (2 min).** Show Smart Pricing reasoning from real data.
7. **Hotels & Guest Houses — the new vertical (2 min).** Search "Murree," show the nightly booking flow.
8. **AI concierge (1 min).** Ask a real question and call out that it's a genuine AI response, not a script.
9. **Close on the mobile app and roadmap (2 min).** Mention the "Coming Soon" placeholders (rider booking, food ordering, job seeker) as visible proof the platform is built to grow.

Things to Be Upfront About, Across Every Demo

- **Deposit Protection** is a real fee/opt-in/claims flow on the platform side, but not yet backed by a licensed insurance underwriter — say so plainly rather than overclaiming coverage.
- **AI-labeled scoring features** (DNA score, trust score, vacancy forecast) are legitimate deterministic calculations, not machine learning — only the concierge, listing-description, finance-anomaly, dispute-summary, and review-classifier features call a real AI model, and only when an API key is configured.
- **The mobile app** is a complete, real source tree, not yet installed, built, or published — a good one-liner: "the app is written and ready to run; the app-store submission is the next phase."
- **Hotel/guest-house guest contact** is shared at booking time (not gated like the long-term student flow) — a deliberate choice given the shorter, lower-risk nature of a short stay.

If Presenting Against a Real Live Deployment

Confirm beforehand: - The Railway backend health check returns OK: `https://basera-api-production.up.railway.app/api/v1/health` - Demo data has been seeded (`npm run seed -- prefix server`) so the accounts above actually exist in the live database rather than only in in-memory demo mode. - The frontend at `https://basera-pk.netlify.app` loads real listings, not just the offline fallback.

See the **Development Master Plan** for the full deployment checklist if any of the above isn't yet true.
